RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 88 pages. Original publisher: Washington, DC : The Office : For sale by the U. S. G. P. O. , Supt. of Docs. , 1993. LC Number: QP801. B69 B57 1993 OCLC Number: (OCoLC)31331659 Subject: Biopolymers. Excerpt: . . . Chapter I - Introduction 9 Some bacteria can store energy in polymer-bearing granules (polyhydroxyalkanoates) that can be collected and made into truly biodegradable packaging like these plastic bottles made from Alcaligenes bacteria by Zeneca Bio Products. recombinant DNA method is necessarily more the polymer itself. Recombinant DNA techniques economical, but that it is possible to generate permit the creation of polymer chains that are virtually uniform in length, composition, and polymers of exceptional structural purity, as well 25 stereochemistry or spatial orientation (see box as manipulate the biopolymer production system I-B). For example, the protein polymer silk that to create new materials. In addition, the recently is produced commercially by silkworms can now developed ability to chemically synthesize DNA 26 be made in recombinant microorganisms. The allows scientists to construct entirely new genes advantage of this new approach is not that the 25 me ee-dlmen lo angement of bi l gic polymer gives rise to specific types of biochemi activity. For example, the Spatial arrangement of an enzyme results in some rmctions being greatly favored over others. It turns out that natural proteins are constructed only from left-h. andai amino acids, and nucleic acids are made up only of right-handed sugars. Their mirror image structures (e. g. , right-handed proteins) are not found in living systems. Although left-handed and right-handed versions (so-called stereoisomers) of any given compound have identical chemical composition and physical properties, they react quite differently biologically and...
